#### **Introduction to Probability**

- Uncertainty/Randomness (不確定性/隨機性) in our life
  - Many events are <u>random</u> in that their <u>result is unknowable</u> before the event happens.

- Will it rain tomorrow?
- How many wins will a player/team achieve this season?
- What numbers will I roll on two dice?
- Q: Is your height/weight measure random?
- ➤ We often want to assess <u>how likely</u> it is the outcomes of interest occur. Probability is that measurement.

NTHU MATH 2810, 2019, Lecture Notes made by S.-W. Cheng (NTHU, Taiwan)

Random v.s. Deterministic Patterns

random	隨機	noise (雜訊)	uncertain result
deterministic	規律	signal (信號)	predictable result

- Consider the two cases:
  - $\triangleright$  Case I ( $\leftarrow$  random pattern?)

1	2	3	4	5	6	7	8	9
R	R	G	R	G	R	R	R	G

➤ <u>Case II</u> (← <u>deterministic</u> pattern?)

1	2	3	4	5	6	7	8	9
R	R	G	R	R	G	R	R	G

 $\triangleright$  Note. #R : #G = 2 : 1

p. 1-2

p. 1-4

- (Possible) modeling:
  - ightharpoonup Case I.  $X_1, X_2, ..., X_n$ , ... are independent, for i=1, 2, ...,

$$X_i = \begin{cases} \underline{R}, & \text{with prob. } 2/3, \\ \underline{G}, & \text{with prob. } 1/3. \end{cases}$$

 $\triangleright$  Case II. For  $i=3, 4, \ldots,$ 

$$\underline{X_i} = \begin{cases} \underline{R}, & \text{if } \underline{(X_{i-2}, X_{i-1})} \in \{(R, G), (G, R)\}, \\ \underline{G}, & \text{if } \overline{(X_{i-2}, X_{i-1})} = (R, R). \end{cases} (*)$$

- Prediction strategy:
  - ightharpoonup Case I: always guess  $X_i = R$  (why? next slide)
  - ightharpoonup Case II: decide  $X_i$  by  $X_{i-1}$ ,  $X_{i-2}$  using (\*)

## NTHU MATH 2810, 2019, Lecture Notes made by S.-W. Cheng (NTHU, Taiwan)

 $\triangleright$  **Q**: why always guess  $X_i = R$  for Case 1?

Let 
$$X_i = \begin{cases} \underline{R}, & \text{with prob. } \underline{p}, \\ \underline{G}, & \text{with prob. } \underline{1-p}. \end{cases}$$

$$\underline{Y_i} = \begin{cases} \underline{R}, & \text{with prob. } \underline{q}, \\ \underline{G}, & \text{with prob. } \underline{1-q}. \end{cases}$$

Then,

• The  $P(X_i=Y_i)$  is maximized at

$$\underline{q} = \begin{cases} \underline{1}, & \text{if } \underline{p > 0.5}, \\ \underline{0}, & \text{if } \underline{p < 0.5}. \end{cases}$$

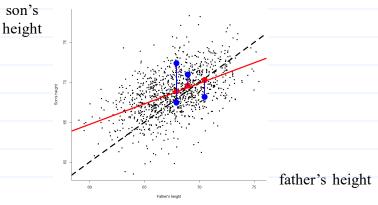

and

$$\max_{q} P(X_i = Y_i) = \begin{cases} \frac{p}{1 - p}, & \text{if } \frac{p > 0.5}{p < 0.5}. \end{cases}$$

- Q: Is Case II really a deterministic pattern?
  - ➤ Under the model for Case I,

$$P(\underline{RRGRRGRRG}) = \left\lceil \left(\frac{2}{3}\right)^2 \left(\frac{1}{3}\right) \right\rceil^3 = \underline{0.325\%}$$

- ➤ Radom pattern Deterministic pattern
- ➤ Deterministic pattern Random pattern
- System containing both random and deterministic patterns
  - ➤ Galton (1875): regression effect

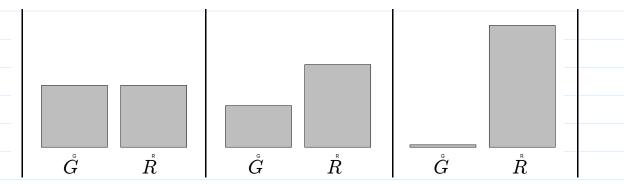

NTHU MATH 2810, 2019, Lecture Notes made by S.-W. Cheng (NTHU, Taiwan)

p. 1-6

## **Random** = totally unpredictable?

• Entropy:  $-[p \log(p) + (1-p) \log(1-p)]$ 

 $\max P(X_i = Y_i)$ 

more random more deterministic more unpredictable more predictable larger entropy smaller entropy

Black swan effect

# **Should everyone have the same probability for an event?**

• Example: 52 cards

- Conditional probability
- Subjective (Bayesian) probability:

紅樓夢的作者是曹雪芹嗎?

信者恆信,不信者恆不信

NTHU MATH 2810, 2019, Lecture Notes made by S.-W. Cheng (NTHU, Taiwan)

#### It's the Chance (Probability, Proportion, Frequency), Stupid

• Bill Clinton, 1992, Campaign slogan

#### It's the Economy, Stupid.

- Examples
  - ▶該買某保險嗎?
  - ▶發生飛機失事事件後,該改成開車嗎?
  - ▶規畫謬誤:蚊子館、該創業嗎?
  - ▶ 敍述謬誤:偉人(成功)的故事
  - ▶賭徒謬誤:擲笅多次未成, 則擲出聖笅機會變大?
  - ▶馬路三寶?汽車保險金額,男>女
  - ▶ <u>車禍</u>先問酒駕? 酒駕易肇事, yes, 但肇事者多酒駕?
  - ▶屏東人:你怎麼不黑?

# Distinction between

## Discovery (發現) and Invention (發明)

- Examples
  - ▶哥倫布"發現"新大陸
  - ▶愛迪生"發明"電燈泡
  - ▶ Q: 相對論是<u>發明</u>還是<u>發現</u>?
- 機率論是人類"發明"來處理生活中的不確定性之理論
- 愛因斯坦: "上帝永遠不會擲骰子"
